

MANUFACTURING NOTICE

Each d2w additive has been formulated for addition to the resin at 1% w/w. i.e. 1% of additive and 99% of resin. In some cases it is formulated for addition at 2%

The low addition-rate means that the additive is generally not invasive to the process and in most cases the process can be run under the same nominal operating conditions as the standard product.

However, deviating from the addition-rate specified by Symphony may provide a different degradation response to that anticipated and should not be attempted without first consulting Symphony's Technical department.

In cases of unauthorised deviation from our manufacturing instructions we cannot guarantee the performance, degradability and shelf-life of the product, and the final product cannot be considered oxo-biodegradable. Furthermore any products bearing the d2w logo with an incorrect inclusion rate will be considered counterfeit.

If the addition rate is incorrect, or if the raw materials and/or processing parameters are different to those declared on the Technical Enquiry Form (or if no TEF has been completed) and manufacturing contravenes Symphony's instructions, we will be unable to consider claims for any additive purchased or in respect of any products manufactured with d2w.

Enquiries regarding inclusion rates and other manufacturing issues should be directed to Symphony's Technical Department via your local Distributor
